Connected Water Metering

Connected Water Metering

Remote, low power data gathering

Water utilities are a labour intensive business, requiring regular visits to customer locations. There is a key driver to reduce overheads through deployment of smart meters, even in remote locations.

Sagentia developed a low energy, low cost water meter for the US domestic market, with automated data capture and communication to the centralised billing system. Our team developed the full meter, communications system and managed service platform controlling billing and maintenance tasks.

Our expertise in sensor design, fluidic handling, low power electronics, wireless communications, and cloud software development delivered a breakthrough product to an established, price sensitive market.
